AMENDMENTS TO THE SPECIFICATION

After the sixth full paragraph on page 8 of the original disclosure (at line 26), please insert the following new paragraphs:

Fig. 3 schematically shows various indicating devices for use with the manual wrench;

Fig. 4 shows an exemplary view of the manual wrench; and

Fig. 5 shows a flat output head for the manual wrench.

After the fourth full paragraph on page 10 of the original disclosure (at line 25), please insert the following new paragraphs:

According to the invention, certain conventional displays and alarms (not shown) may be utilized in combination with the wrench of the instant invention to be activated upon attaining a specified target tightening torque. The use and arrangement of these displays and alarms in handheld tools are conventionally known to be simple, functionally reliable, and inexpensive. For example, a display can be mechanically activated in a conventional manner, e.g., by an axially movable pin, a pivotably movably mounted bar, etc. Additionally or alternatively, an electrical sensor can be utilized in a conventional manner to generate a signal when the specified target torque is obtained. Signals from the electronic sensor are evaluated in a known manner by an electronic circuit in order to trigger conventional acoustic or optical devices when the target torque is obtained. The mechanical or electrical visual or acoustic display may be conventionally located in head 1 of the manual wrench, which would advantageously locate these displays in an optical and visual range of the user in a known manner.

Further, the wrench handle can be a conventional tubular housing accommodating a motor 28 and an output shaft 29 of the motor in a known manner. Optionally, the motor can be coupled in a conventional manner to a wireless power supply. Housing can be designed with high bending strength, which bending strength during manipulation of the wrench allows for the transmission of considerably higher tightening torques to the output tool shaft than from the motor drive. Moreover, the rod-shaped tubular housing can include a conventional grip area for manual actuation of the wrench.
